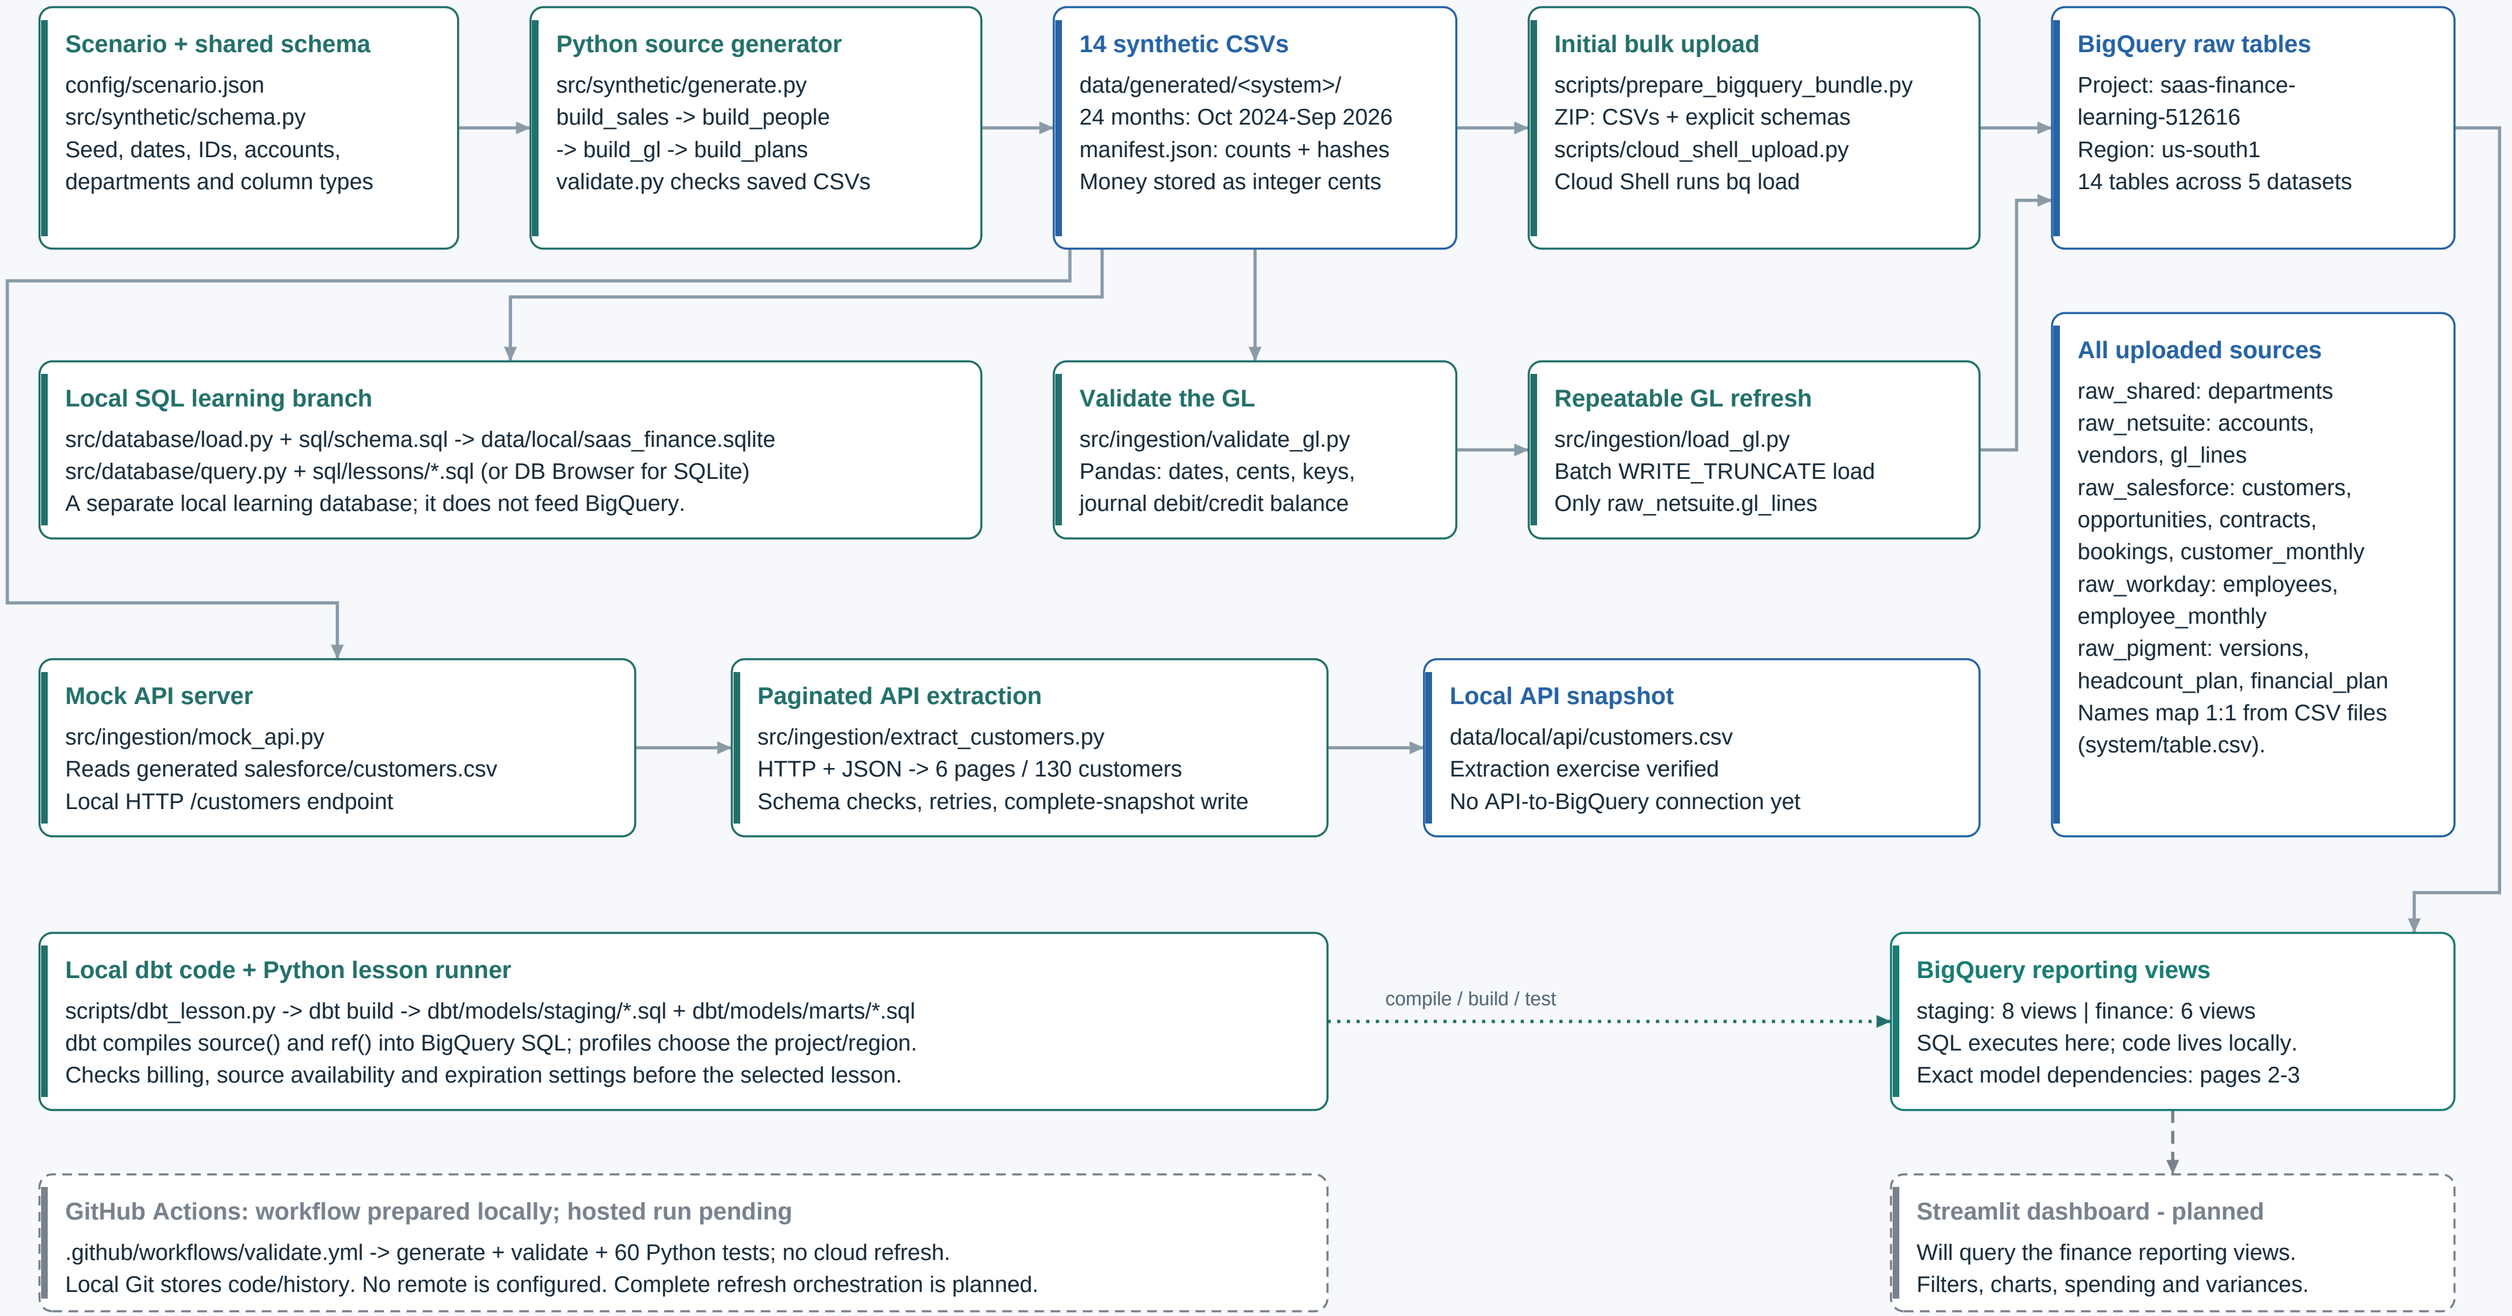
How the whole platform connects

Python runs locally or in Cloud Shell. BigQuery stores raw tables and executes the SQL behind dbt views.

SOLID Data read / transformation DOTTED Control / validation DASHED Planned connection



Accounting and planning: exact SQL lineage

Each staging/reporting box is one .sql file and one BigQuery view. Arrows show direct model dependencies.

SOLID Data read / transformation DOTTED Control / validation DASHED Planned connection

BIGQUERY RAW

raw_netsuite.accounts
Account IDs, names, types

raw_netsuite.gl_lines
Journal lines; debit / credit

02_gl_control.sql
Raw debit / credit totals

raw_pigment.versions
Budget / Forecast versions

raw_pigment.financial_plan
Version / month / dept / acct

STAGING VIEWS

stg_accounts
Account classifications

stg_gl_lines
GL line detail in cents

stg_plan_versions
Version IDs + period scope

stg_financial_plan
Plan amounts in cents

FINANCE VIEWS

rpt_pnl_monthly
Grain: one row per month
Revenue, expense, operating profit
Revenue = credits - debits
Expenses = debits - credits

fct_pnl_monthly
Grain: month / department / account
Revenue and expense actuals
Excludes balance sheet accounts
Supports department spend analysis

Account type controls favorable sign

fct_budget_vs_actual
Grain: version / month / dept / acct
Currently selects BUD2025 only
FULL OUTER JOIN actual + budget
Retains missing-side records
Raw and favorable variances
Zero budget -> NULL ratio

READ-ONLY SQL

05_bookings_revenue_arr.sql
Reads this P&L view plus
ARR and bookings views.
See page 3 for the other inputs.

03_budget_vs_actual.sql
Summarizes by month
and account type.
Converts cents to dollars.

Validation layer (selected examples; not extra reporting tables)
dbt/tests/: gl_journals_balance.sql, pnl_reconciles_to_raw.sql, budget_reconciles_to_raw.sql

Uploaded, but not used by current dbt models
raw_netsuite.vendors: source generation / local validation
raw_pigment.headcount_plan: source and plan validation
Neither is currently declared as a dbt source.
Department names come from the shared source (page 3).
Paths: dbt/models/staging/ and dbt/models/marts/

SaaS and workforce: exact SQL lineage

Calendar inputs preserve zero-activity months. Supporting raw records also feed validation, separately from reporting models.

SOLID Data read / transformation DOTTED Control / validation DASHED Planned connection

BIGQUERY RAW | STAGING VIEWS | FINANCE VIEWS | READ-ONLY SQL

raw_salesforce.customer_monthly
Customer / month MRR and ARR

stg_customer_monthly
One row per customer / month

rpt_arr_monthly
One row per month: MRR, ARR,
active customers, ARR change / growth
Active customer: MRR > 0

04_arr_trend.sql
Displays dollars and growth %

month calendar

raw_salesforce.bookings
One row per signed booking event

stg_bookings
Signed value: new business / renewal

rpt_bookings_monthly
One row per month: counts + value
New business / renewals separated
Customer snapshots supply the calendar

05_bookings_revenue_arr.sql
Joins 3 views on month:
rpt_bookings_monthly, rpt_arr_monthly,
rpt_pnl_monthly (from page 2)

raw_workday.employee_monthly
Employee / month payroll + FTE

stg_employee_monthly
Base pay + bonus + benefits

rpt_workforce_monthly
One row per month / department
Headcount, FTE and personnel costs
Months x departments -> retain zeros
Payroll costs already belong in the GL

06_workforce_summary.sql
Aggregates departments by month.
Displays FTE and payroll dollars.

raw_shared.departments
Shared department ID and name

stg_departments
Department name + function

raw_netsuite.gl_lines (page 2)
DISTINCT month supplies reporting calendar

01_departments.sql
Reads raw_shared.departments directly.
Replace YOUR_PROJECT_ID before use.

Supporting raw records: validation inputs
raw_salesforce.customers / contracts / opportunities; raw_workday.employees
These 4 tables are declared dbt sources but are not direct model inputs.

Data quality and reconciliation tests
Customer coverage; bookings vs signed contracts / won opportunities; roster coverage.
Employee/month/account payroll vs raw GL: personnel_costs_match_gl.sql.
